

Why Choose MobileTogether?

Altova MobileTogether is an affordable framework for building data-centric apps for all platforms. Apps are built by your in-house IT or development team, so there's no need to hire specialized mobile developers. Native apps are completed and delivered to end users on their mobile device of choice – smart phone, tablet, laptop, or all three – in record time.

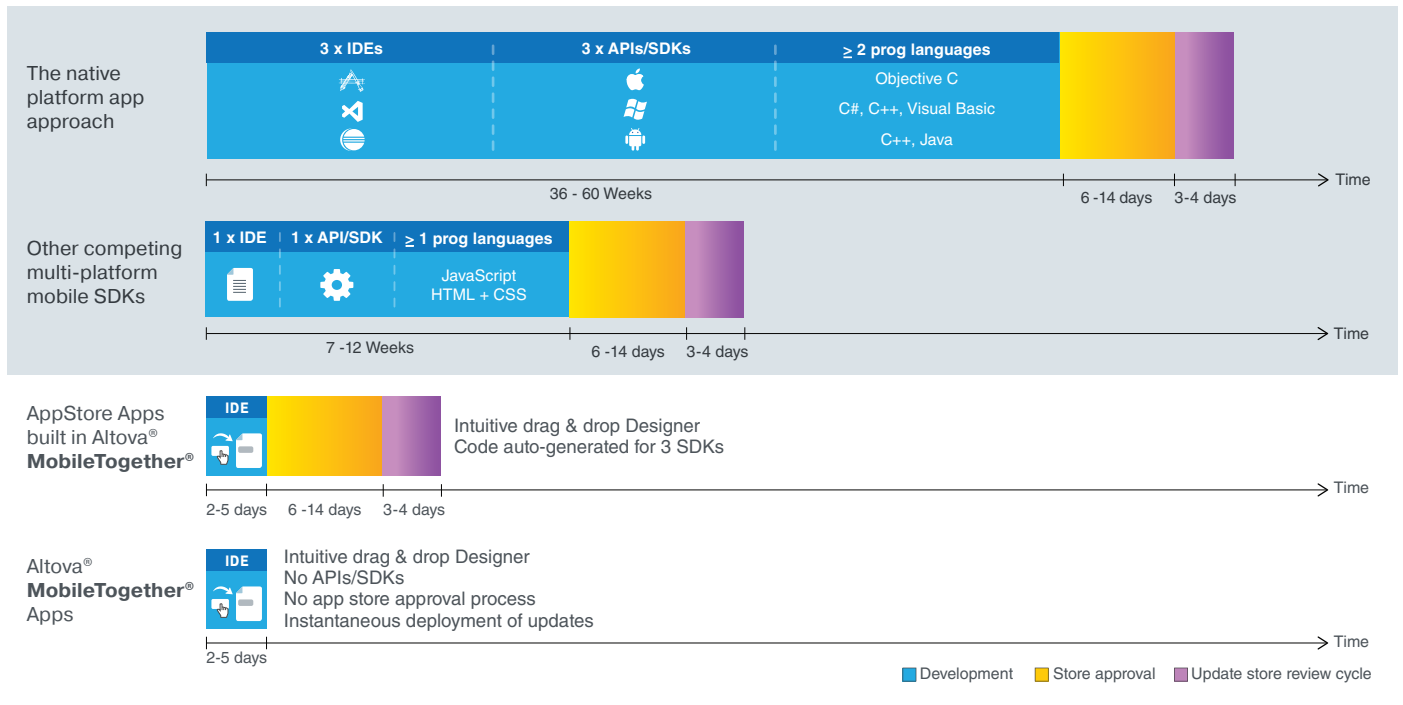

MobileTogether	Benefit to your business
 Build and deploy native apps in days	Time savings – see reverse for details
 Affordable framework for sophisticated apps	Low cost of entry and rapid ROI
 Connectivity to all business back-end systems	Create apps around business processes
 Cross-platform capabilities	Build once; serve users on any mobile device (BYOD)
 Efficiently and securely mobilize enterprise data	Increase productivity and your bottom line

How does it work?

- 1 Developer or technical user uses the MobileTogether Designer to build a mobile app.
- 2 Developer deploys the mobile solution to your MobileTogether Server (either on-premises or in the cloud).
- 3 End users access the solution – with robust security considerations – by connecting to your MobileTogether Server on their mobile device. They simply download the free, MobileTogether App from their app store of choice and connect to your server.
- 4 If further customization is required, developers add custom branding, compile a native app for each platform, and submit it to the app store.

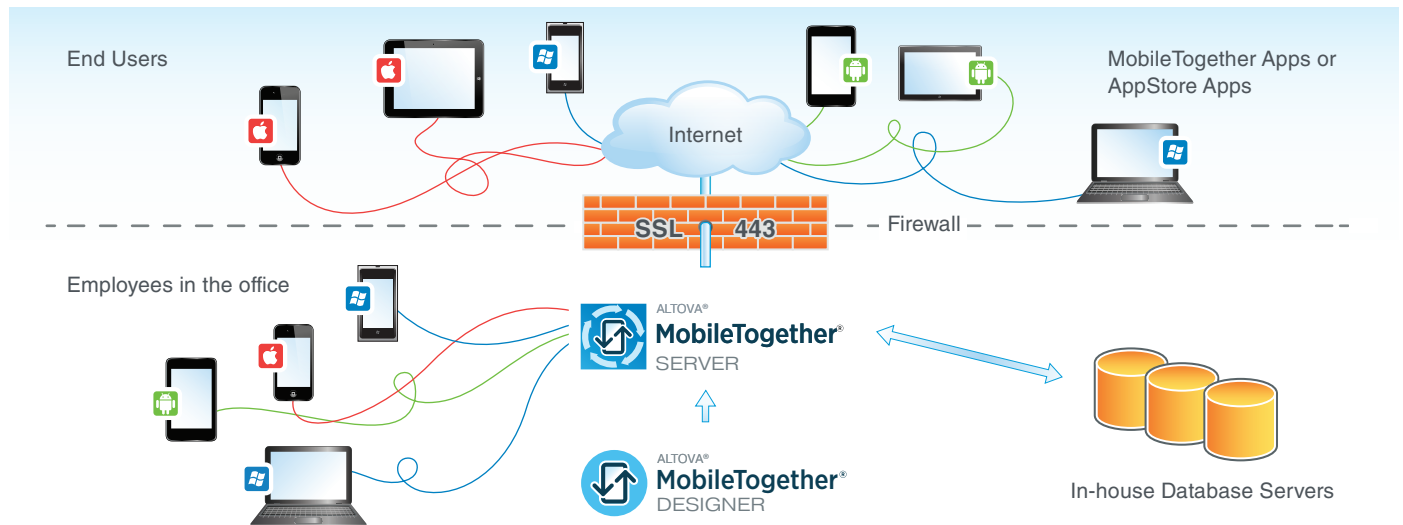

Zero to App in 2-5 Days with MobileTogether

MobileTogether Server

Apps developed in MobileTogether Designer are deployed to your MobileTogether Server, which provides connectivity to data sources and high-performance data processing, including sophisticated cache control options. MobileTogether Server is priced to scale affordably for deployments small and large, with per-device licensing (for typical enterprise scenarios) and per-core licensing for public-facing apps.

Supported Platforms:

- Android
- iOS
- Windows Phone 8
- Windows 8, Windows 10
- HTML-5 Browser Based Client

Connect to Backend Data in:

- Relational databases
- XML
- Web Services
- JSON
- HTML
- And more
